

## META COGNITIVE STRATEGY USAGE AND EPISTEMOLOGICAL BELIEFS OF PRIMARY SCHOOL TEACHER TRAINEES: AN EXPLORATIVE STUDY

**Dr. Parkash Chandra Jena\* & Latif Ahmad\*\***

---

### ABSTRACT

*The main purpose of the study is to identify different levels of metacognition and epistemological beliefs of primary school teacher trainees. The investigator has taken 300 primary school teacher trainees from three districts of Jammu and Kashmir by using simple random sampling technique. For collection of data the investigator has used Metacognitive Inventory (MCI) by Punita Govil and Epistemological Belief Questionnaire (EBQ) constructed and standardized by the investigators. For analyses and interpretation of data the investigator has used percentage and Pearson's Co-efficient of Correlation.*

**Key words:** *Metacognitive, Epistemological Belief, Innate Ability Belief, Simple Knowledge Belief, Certain Knowledge Belief*

---

### INTRODUCTION

Globalization and advancements in technology are driving changes in the social, technological, economical, environmental and political landscapes at a rate and magnitude that is too great, and too multiple to ignore. As society changes, the skills that students need to be successful in life also change. Basic literacy skills of reading, writing, and arithmetic are no longer sufficient. Our students need to master those basic skills as well as read critically, write persuasively, think and reason logically, and solve complex problems. A successful student must be adept at managing information, finding, evaluating and applying new content understanding with great flexibility. They must be equipped with skills and perspectives designed to help them anticipate change. This is possible only by the help of teachers, who possess the potentialities like metacognitive thinking and mature beliefs towards knowledge.

Metacognition is the understanding and awareness of one's own mental or cognitive process. The metacognition is very helpful for distance learners. In distance education, there is no face to face interaction between learner and teacher to understand the content, and clarify the difficulties. In this scenario, the learner has to learn the content by himself or herself. There is a

dynamic relationship between the learner, and the learning materials. This dynamic relationship activates through metacognition. Metacognition involves self correction, self assessments, and self reflection. So these elements become essential in distance education environment, where the learner learns the materials by using strategies of self assessments, self reflection, and self evaluation.

Epistemological beliefs are those concerning the nature of knowledge and knowing. These beliefs actually affect interpretation of learning tasks and comprehension. In the field of education, epistemological belief is an important construct, and is frequently used to predict achievement of the students. Epistemological beliefs are considered to be a lens through which individuals interpret information, set standards, and decide on an appropriate course of action. There is an increased need to recognise the students' beliefs about knowledge that influence their behaviour and academic achievements through cognitive, self-regulated learning strategies and decision making skills. Teachers with developed epistemological beliefs are able to apply their plan for instruction based on students' level of epistemology. These beliefs are likely to

influence how students learn, how teachers instruct and subsequently how teachers modify students' epistemological beliefs. A clearer understanding of sophisticated personal epistemology will be useful for adult educational contexts within spiritual communities, where a belief in absolute or certain revealed knowledge is more likely to be a shared intellectual value.

**OBJECTIVES OF THE STUDY**

1. To explore different levels of metacognition of primary school teacher trainees.
2. To explore different levels of epistemological beliefs of primary school teacher trainees.
3. To find out the relationship between metacognition and epistemological beliefs of primary school teacher trainees.

**HYPOTHESES OF THE STUDY**

1. There exists no significant difference in metacognitive strategy usage of primary school teacher trainees so far as the gender is concerned.
2. There is no significant relationship between metacognition and epistemological beliefs of primary school teacher trainees.

**METHOD**

Present study is explorative one and descriptive survey method has been used by investigator. The sampling frame of the study comprises all primary school teacher trainees of three districts of Jammu and Kashmir namely Anantnag, Budgam and Pulwama. The investigators have selected 300 primary school teacher trainees as sample from six teacher training institutions by using simple random sampling technique with equal proportion of male and female.

**TOOLS USED**

Following tools have been used for the data collection.

1. Metacognitive Inventory (MCI) constructed and standardized by Punita Govil in 2003
2. Epistemological Belief Questionnaire (EBQ): constructed and standardized by investigators in 2011.

**STATISTICAL TECHNIQUES USED**

Following statistical techniques have been used for data analyses and for interpretation of results:

Percentage and Pearson's Co-efficient of Correlation.

**Result Pertaining to the Different Levels of Metacognition of Primary School Teacher Trainees**

For the classification of different levels of metacognition of 300 primary school teacher trainees, the investigators have used Metacognitive Inventory constructed and standardized by Punita Govil and result is presented in table no.1

**Table No.1  
Frequency and Percentage of Primary School Teacher Trainees in the Different Levels of Metacognition**

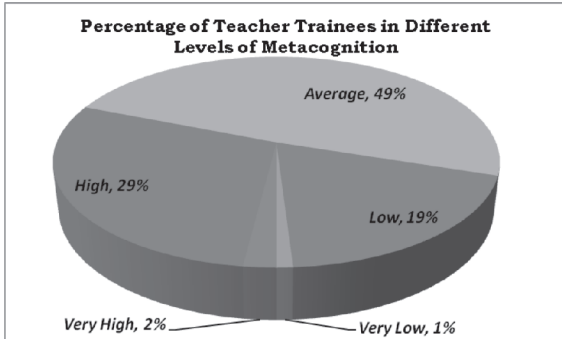

S. No.	Levels of Metacognition	Frequency	Percentage
1.	Very High	6	2%
2.	High	88	29%
3.	Average	145	49%
4.	Low	57	19%
5.	Very Low	4	1%
<b>Total</b>		<b>300</b>	<b>100%</b>

The table no.1 shows the distribution of three hundred primary school teacher in the different levels of metacognition. The percentage of primary school teachers in different levels of metacognition are very high(2%), high(29%), average(49%), low(19%) and very low(1%). The same has been shown in figure no.1 and 2

**Figure No.1**

**Figure No.2**

**Result Pertaining to the Different Levels of Epistemological Belief of Primary School Teacher Trainees**

For the classification of different levels of epistemological belief of 300 primary school teacher trainees, the investigators have used Epistemological Belief Questionnaire (EBQ) constructed and standardized by investigators and the result is presented in table no.2

**Table No. 2**

**Frequency and Percentage of Primary School Teacher Trainees in Different Levels of Epistemological Belief**

S. No.	Levels of Epistemological Belief	Frequency	Percentage
1.	Mature	71	24%
2.	Moderate	191	64%
3.	Naive	38	12%
Total		300	100%

Table no.2 reveals that majority (64%) teacher trainees were identified as having moderate epistemological belief, 24% teacher trainees were identified as possessing mature epistemological beliefs and 12% possess naive epistemological belief. The same has been shown in figure no. 3 and 4 below.

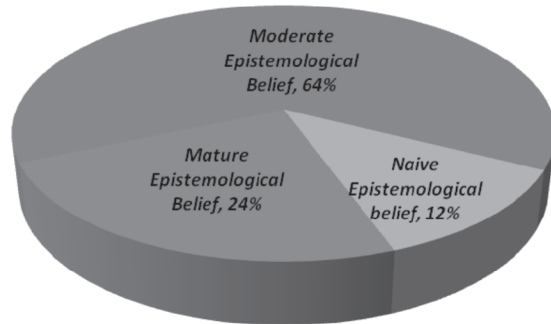

**Figure No. 3**

**Bar Graph showing the Frequency of Primary Teacher Trainees in Different Levels of Epistemological Belief**

**Figure No. 4**

**Pie Chart showing the Percentage of Primary School Teacher Trainees in the Different Levels of Epistemological Belief**

**Results Pertaining to the Relationship between Metacognition and Epistemological Belief of Primary School Teacher Trainees**

To find out the relationship between metacognition and epistemological belief of primary school teacher trainees, Pearson's correlation co-efficient was applied and the result was presented in table no. 3

**Table No. 3**

**Results of Co-efficient of correlation between Metacognition and Epistemological Belief of Primary School Teacher Trainees**

Variables	N	df	r	Significance
Metacognition	300	298	0,464	P<0.01
Epistemological Belief				

(Value of “r” at 0.05 and 0.01 Levels of Significance are 0.11 and 0.148)

The table no. 3 depicts that the coefficient of correlation between metacognition and epistemological beliefs among primary school teacher trainees is greater than the table at both the levels. It is concluded that there exists a significant relationship between metacognition and epistemological beliefs of primary school teacher trainees. Therefore the hypothesis no.5 which reads as “there is no significant relationship between metacognition and epistemological beliefs of primary school teacher trainees” was rejected. Positive relationship between metacognition and epistemological belief reveals that the teacher trainees who were more aware about their metacognitive strategies possess sophisticated epistemological beliefs. The results were in correlation with the findings of Kuhn (2001), who stated “To fully understand processes of knowing and knowledge acquisition, it is necessary to examine people's understanding of their own knowledge”

### **RESULT ANALYSIS AND MAIN FINDINGS**

#### **Levels of meta cognition of primary school teacher trainees**

So far as the levels of metacognition of three hundred teacher trainees is concerned, it has been found that 2% teacher trainees have very high level of metacognition, 29% have high level, 49% have average level, 19% have low level and 1% have very low level of metacognition.

#### **Levels of epistemological beliefs of primary school teacher trainees**

Regarding the levels of epistemological belief of three hundred teacher trainees, majority of teacher trainees (64%) were identified as having moderate epistemological belief, 24% teacher trainees were identified as possessing mature epistemological beliefs and 12% possessing naive epistemological belief.

#### **Relationship between metacognition and epistemological belief of primary school teacher trainee**

There exists a positive significant relationship between metacognition and epistemological

beliefs of primary school teacher trainees. Significant positive relationship was also found between metacognition and epistemological belief of male primary school teacher trainees.
